
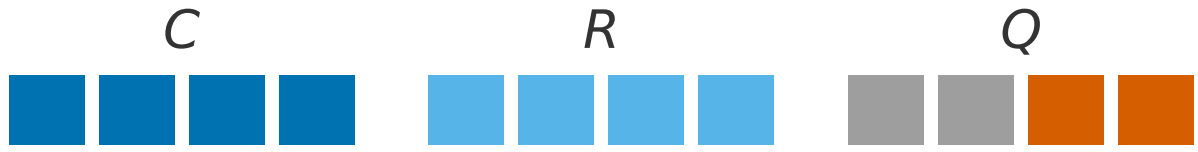
Slice-level split

On a slice-level reading of the stated ratios, the slices of one recording land in training, validation and test alike.

Recording-level split



As used here, a recording is never split: training recordings C, validation recordings R, and test recordings Q, whose slices are half sealed and half held out as a pool.

Exposure arm (A1)

Pool slices (orange) replace an equal number of C slices, so the budget is unchanged; the dashed outlines in Q mark the same slices at their old position. Not every test recording contributes to the pool.

Schematic: the counts are illustrative, not the 8:1:1 ratio.
